

Chapter 3: Operators & Expressions

Operators are special symbols used to carry out arithmetic and logical computations on variables and values. Categories of Python Operators: 1. Arithmetic Operators: Used for mathematical calculations including addition (+), subtraction (-), multiplication (*), division (/), floor division (//), exponentiation (**), and modulus (%). 2. Comparison Operators: Used to compare values, returning a boolean result. Examples include equal to (==), not equal to (!=), greater than (>), and less than or equal to (<=). 3. Logical Operators: Combine conditional statements using and, or, and not. 4. Assignment Operators: Modify variable values using shorthand notations like +=, -=, and *=.
