

Chapter 5: Loops & Iteration

Loops are programming structures designed to repeat a block of code multiple times until a terminating condition is met. Types of Loops: 1. for loop: Used for iterating over a sequence such as a list, tuple, dictionary, set, or string range. 2. while loop: Repeatedly executes a statement block as long as a designated test expression remains true. Control Keywords within Loops: - break: Immediately exits the enclosing loop. - continue: Skips the current iteration and advances directly to the next loop cycle.
