

Chapter 6: Functions & Scope

A function is a reusable, self-contained block of code organized to perform a specific related action, defined using the `def` keyword. Key Concepts: - Parameters and Arguments: Inputs passed into functions for processing. - Return Values: Outputs sent back using the `return` statement. - Variable Scope: Defines where a variable is accessible within your program. * Local Scope: Variables created inside a function body. * Global Scope: Variables declared outside any function body, accessible globally.
