

Chapter 9: Strings & File Handling

String manipulation and external file persistence are core foundational tasks in Python application development.

1. String Operations: - Strings support slicing, concatenation, formatting via f-strings, and utility methods like `split()`, `join()`, and `replace()`.
2. File Handling: - Built-in `open()` function manages reading and writing external files. - File Modes: 'r' for reading, 'w' for writing, and 'a' for appending data. - Context managers (with statements) ensure files are cleanly and automatically closed after execution.
